Peer Review Questionnaire Overview

FORM PREPARATION

A structured Google Form to collect usability feedback from another group. Reviewers watch a video demo of HelpMate, then test the live app on a real iPhone before completing the form.

Goal: validate core user flows and identify pain points before final delivery.

KEY SECTIONS

6 sections covering the full app journey:

1. Register & Avatar Creation
2. Map Screen — pin colours & filters
3. List of Posts — distance sorting
4. Post Creation — ease & photo upload
5. Post Detail — urgency & trust signals
6. Chat Screen — in-app messaging

RATING SCALES

Each section uses 1–5 star ratings for quantitative scoring, paired with open-ended questions for qualitative insight.

Results will directly feed into our next sprint to prioritise fixes and feature improvements ahead of final submission.

Development Updates

HelpMate

can keep you safe

APP EXPORTED

HelpMate now runs natively on a physical iPhone — no longer limited to the Expo terminal or simulator. This is a key milestone: our peer reviewers can interact with the live app on a real device during the demo session, giving us authentic usability feedback under real-world conditions.

3D AVATAR COLOUR RENDERING — IN PROGRESS

3rd Party API to generate 3D avatars from user-uploaded photos.
Current issue: the GLB file saved to our database loses its texture and colour when re-imported into the app. Placement of the avatar on screen is also being refined.

LEADERBOARD PAGE — IN PROGRESS

Working baseline, but still experimenting with different page layouts and element placement
And general design style of the app is still in refining process

Thank You for Listening
